Stag Beetle

ECOLOGICAL ROLES

Hive

Model

Leafcutter

Ant

Builders

make shelters to provide protection and food storage for themselves and for "guest" species that live with them

"Insects of NYC"

Interactive Table

Decomposers

break down rotting plants, dung, and carcasses, which removes waste, recycles nutrients, and creates soil

Golden-Eyed

Stick Insect

Herbivores

eat plants, and every plant species on Earth probably has at least one insect species that eats it

Honeypot

Ant

Blue Death-Feigning

Beetle

enter

Pollinators

are necessary for the fertilization of about 75% of food-crop plant species and 80% of flowering plant species

Predators

eat insects and other animals, including animals bigger than themselves

Explore Ecological Roles

How does an insect's ecological role affect other organisms in their shared ecosystem?

- **1. Choose four live insects** to observe closely. For each insect:
 - Name and sketch it
 - Record its ecosystem
- Circle its ecological role(s)

builder

decomposer

herbivores

pollinator

predator

- **2. Visit** these areas of the hall to learn about the ecological roles of the four insects:
- "Build Up and Break Down" wall (builder, decomposer)
- "Eat and Get Eaten" wall (herbivore, predator)
- Flower and bee models (pollinator)
- Hive model (pollinator)

Add notes about each insect:

- one trait that enables the insect to perform its role
- how the insect's role affects other organisms in their shared ecosystem

Explore more! Visit the "Insects of NYC" interactive table to learn about insect roles in a local ecosystem.
